## Custom Designed Moulds and Tools Engineered to Meet Your Specific Needs

At InoxNISGE, we pride ourselves on manufacturing the highest quality moulds using only AISI 304L stainless steel. This advanced stainless steel alloy provides extraordinary corrosion and oxidation resistance, thus guaranteeing a long service life for our products.

The 304L stainless steel also facilitates cleaning and maintenance of the moulds. Its smooth, non-porous surface prevents build-up of bacteria and potential contaminants. This is essential for meeting the highest hygiene standards in food production.

Additionally, this material allows rapid, uniform heat exchange, optimising cooking and cooling processes.

### Our mould manufacture:

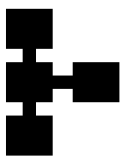

#### **Facilitates cleaning thanks to its non-stick properties**

The 304L stainless steel has a smooth, non-porous surface that prevents food from sticking and allows any residue to be cleaned off easily.

#### **Is highly resistant to corrosion giving it unlimited durability**

The 304L alloy is specifically designed to withstand intensive use environments without corroding or wearing over time..

#### **Eliminates any risk of oxidation even after years of use**

Unlike carbon steel, 304L stainless steel does not oxidise or rust, which could contaminate food.

#### **Improves efficiency in food cooking and cooling**

The high thermal conductivity of stainless steel accelerates the heating and cooling processes, reducing production times.
